# Nairn brings you floors of "Never Before" Beauty and Service-ability

NAIRN VINYL TILE FLOOR LAID  
IN THE X-RAY DEPARTMENT OF  
IPSWICH BOROUGH GENERAL HOSPITAL

Proprietors, managers and executives of business premises and institutions all over the country are specifying Nairn Vinyl Tile Floors. Housewives, too, are making enquiries at their architect's or builder's about Nairn Vinyl Tile Floors. Everywhere the news is spreading that Nairn brings you floors of 'never before' beauty and utility.

**'Never Before' Wear-ability** Since the floors of the 53 laboratories in the new Biology Building of Nottingham University would be subject to continual traffic and exposure to all manner of chemicals, the University laboratories themselves tested various types of floor covering. Nairn Vinyl Tiles proved to be the most satisfactory and were used exclusively.

**'Never Before' Clean-ability** Grease, oil, mud... bleach, alkalis, cooking fats... all the things that might ruin an ordinary floor don't affect a Nairn Vinyl Tile Floor. And all that's needed to keep it shining clean is an occasional polishing.

**'Never Before' Versatility** Nairn Vinyl Tile Floors can be laid on any kind of level surface, upstairs, downstairs or in the basement. As a design component the Nairn Vinyl Tile is extremely versatile too... AND, LAST BUT NOT LEAST THE COST IS SURPRISINGLY LOW.

For years, both here and in the U.S.A., laboratory research and stringent practical tests have proved the wear-resistance of Nairn Vinyl Tile Floors.

Please write to us (at Office 104) for further information, literature and advice.

**MICHAEL NAIRN & CO., LIMITED, KIRKCALDY, SCOTLAND**

CANADIAN

## Spruce

**A Canadian wood, creamy white in colour and sometimes tinged with red, that has a wide range of uses.**

**TYPICAL USES**

Light and medium construction, agricultural implements, windows and doors, shelves and general carpentry

Scaffolding, ladders, kitchen furniture

Wagon boxes, concrete forms, pumps, tanks and silos

Oars and paddles, organ pipes, sounding boards for musical instruments

Pulp and paper, rayon pulp and cellophane

Food containers, butter and cheese boxes, cooperage

**SPECIAL ADVANTAGES**

Strong for its weight, yet comparatively soft and very resilient

Seasons readily and uniformly

Easily worked, takes smooth satiny finish

Takes paints, varnishes and enamels well

Minimizes "wood tainting" in packaging of foods, butter, etc.

Takes nails without splitting and holds them well

FOR FURTHER INFORMATION concerning Canadian woods contact The Commercial Secretary (Timber), Canada House, Trafalgar Square, London, S.W.1.

**WOOD IS NATURE'S BEST BUILDING MATERIAL**

Reproduced here is figure of Canadian Spruce.

This advertisement is one of a series featuring Canadian Douglas Fir, Red Pine, White Pine, Western Red Cedar and Pacific Coast Hemlock.

## funny things, coats . . .

. . . but it is not often that their purpose in life is a laughing matter.

Whether for buffoonery or industry, coats have very specific work to do. Cellon are specialists in coats and they take their coat-making seriously. They make them to measure for industry—in the right materials and colours for every individual requirement in the widely varied field of industrial protection. Moreover Cellon Chemists and Technicians are constantly formulating, blending and testing new finishes for unusual and specialised applications. With this vast and steadily increasing reserve of standard and special finishes at your service you are always certain, when you consult Cellon, of the right coat to fit your particular job.

## THE MATHEMATICS OF CENTRAL HEATING AND HOT WATER SUPPLY

*The cost of any heating service is equal to the sum of*

- (a) the cost of appliance and installation
- (b) cost of fuel
- (c) cost of labour required
- (d) cost of service and maintenance.

**EXAMPLE 1:** If oil is the fuel to be used for the supply of hot water for central heating and domestic purposes, would it be most economical to employ a DOA Series Potterton Oil-Fired Boiler?

- (a) the Potterton Oil-Fired Boiler is supplied as a complete unit thus ensuring minimum installation costs
- (b) it was designed specifically for oil firing and it is thus able to achieve a true working efficiency of 80% of the heat from the oil transferred to the water. (The maximum efficiency that can be used in any boiler without the risk of condensation)
- (c) it has fully automatic oil burners and thermostatically operated controls and therefore the manpower required is negligible
- (d) careful design and manufacture ensure that very little maintenance is required.

∴ Since  $a + b + c + d =$  the cost of Heating Service it may be seen that the Potterton Oil-Fired Boiler is the most economical means of supplying hot water for central heating and domestic purposes if oil is the fuel to be used.

Note: The output of any DOA Series Boiler is given by B.Th.U./Hr.  $= 36000x$ , where  $x$  = number of sections and can have integral values from 3 to 8.

We will be very pleased to put our mathematicians to work to show just how economical such an installation would be in your particular case, if you will write to Thomas De La Rue & Co. Ltd., 20/30 Buckhold Rd., Wandsworth, London, S.W.18.

## How was it done in this Glasgow factory?

Metropolitan Vickers & Marinite Ltd. made this saving by the installation of 300,000 sq. ft. of Heywood's Thermal Insulation on walls and roof spans. In buildings of this type where large spans, lofty roofs and, above all, natural daylighting are essential, the problem of heat conservation is acute. Rising fuel costs and threatened shortages will greatly stimulate the demand for thermal insulation. Heywoods, having specialised in this field for many years, have the experience and facilities to meet this demand.

In addition to Thermal Insulation there will be an increasing need for our Patent System of Double Glazing. The advantages of Double Glazing are obvious, but for full details, specifications, etc., write for literature or ask our technical representative to call.

*When you specify*  
**EWART** INSTANTANEOUS GAS WATER HEATERS  
*you specify dependability*

There are solid reasons for the dependability of Ewart water heaters. They are built to give long service with the minimum of maintenance.

- \* They have self-clearing steatite-tipped Bray burners that resist corrosion and blockage. The types of heat-exchanger employed are simple and designed to maintain a full flow of air and products of combustion, and thus obviate fouling of the flueways.
- \* Automatic gas governors are fitted to these Ewart water heaters to prevent over-gassing and ensure consistent performance, thereby prolonging the life of the heating bodies.
- \* Where pilot safety devices are fitted they are of exceptionally robust design. Alternatively, the interlocking tap safety device is of a well-tried pattern.

**EWART M75.** A sink water heater. Can easily be adapted as a multipoint to supply two sinks or handbasins—through existing taps if desired.

**EWART S140.** A low-priced highly efficient instantaneous bath water heater. Will also supply adjacent handbasin through swivel spout.

**EWART M210.** A multipoint water heater which will supply instant and endless hot water in bathroom, kitchen, cloakroom, etc.

**EWART** famous for over 120 years!

*Exposure!*

*Dry Rot!*

*Insects!*

To keep **wood** safe  
from all forms of rot and decay,  
use **PRESOTIM**

**Presotim** is a decorative wood preservative produced from a series of highly refined coal-tar oils blended to provide extra-deep penetration even when applied by brushing.

**Presotim** is effective against timber decay whether caused by fungi, exposure, or attack by insects such as Death Watch Beetle and Furniture Beetle.

**Presotim** is recommended for use both outdoors and indoors. Presotim (exterior quality) is suitable for pavilions, outbuildings, fences, gates, boats, barges, and for roof timbers in houses. Presotim (interior quality) preserves panelling, doors, skirtings, etc., without obscuring the natural beauty of the grain.

**Presotim** is prepared in a special "neutral" grade which makes it especially effective for old and valuable timbers such as church roofs and panelling, where it protects without altering the characteristic colour of the wood.

**Presotim**-treated timber can be polished or varnished as required.

For work where a thoroughly reliable, well-tried wood preservative is needed, Presotim offers to architects, builders and others long-term protection against decay at very low cost.

**HOW PRESOTIM IS SUPPLIED**

Presotim is marketed in small containers, 5, 10, and 40-gallon drums. It is available in neutral grade, three shades of brown and twelve other attractive colours.  
Prices from 4/- per gallon in 40-gallon drums.

# You were right!

I wrote to **DUSSEK**...

They told me all I needed to know about that "Plasbestos" stuff you were talking about; I'm certainly going to give it a try. And what I liked was the way they offered to give me a hand with any other problems I had.

Well, I told you they were out to give us all the help they could.

You're right there. They sent me full details about some stuff called "Plasphalt", as well.

I've heard of that—Plastic roofing paste, isn't it?

Yes. I reckon it's just the job for waterproofing roofs. To start with, it's easy to put on—spread it cold with a trowel. And you can put it on anything; tiles, zinc, concrete—the lot. You can put it into jointless floors and cement and other mixes to make them waterproof too.

You can bet it will be O.K., if Dussek make it; I've never found anything of theirs wanting. I've a good mind to put it on that new property of mine at Hillcrest. You know it's an exposed spot, and I don't want any rain finding its way in there. Good idea to stop the leaks before they start.

Well, if you go to Dussek, that's one problem you'll be able to forget about... hey, look here, I'd better get back to the site. See you again.

## Six out of seven won't be needed

Any client of yours who, following your advice, achieves a fuel saving of that order, has good reason to be satisfied. And that advice is simple: instal Celotex Cane Fibre Insulation. Here are the facts.\* On the basis of a 5000-hours heating period, an uninsulated, steel framed asbestos-roofed building requires 7.8 tons of fuel for every 1000 sq. ft. of sheeted area to produce a comfortable working temperature. But instal Celotex Cane Fibre Insulation—and immediately the fuel requirement drops to 1.8 tons. And nobody suffers; the smaller fuel requirement does all the work of the larger and does it better. Moreover, the economy is permanent. The *only* cost of Celotex Insulation is the very moderate cost of installation. To every client with a fuel problem, recommend the immediate installation of . . .

## *specially engineered for oil-firing*

No ordinary boiler can match performance with the new KAYENCO 'HIKON'... the oil-fired boiler with a flue-loss of only 14% and a guaranteed net efficiency of 80%. These remarkable figures result from its high degree of convection extraction, achieved through skilled design and precision engineering by specialists in oil-fired boiler manufacture.

### FEATURES OF THE KAYENCO 'HIKON' ARE:

- Long Finned Flueways for maximum heat extraction.
- Integral Draught Stabiliser.
- 'Blanket' Insulation to reduce radiation loss.
- Precision-sized Combustion Chamber.
- All-steel, one-piece Boiler Shell.
- Easily accessible for inspection.
- Completely enclosed. Fully automatic.
- Handsome Enamel finish. Attractive colours.
- Compact, clean, safe.

Models from 125,000 B.T.U.

Flats at Hamilton Terrace, Abercorn Place. Architect: Clifford Culpin, F.R.I.B.A.

Member of the  Metal Window Association

It is a significant fact that to-day more Beacon Windows than ever before are being exported to countries where humidity is high and where rust plays havoc with unprotected metal surfaces. The reason is simple. From Panama to Malaya architects have learned how much more efficient is the Thompson 3-stage Zinc Metallisation Process in combating rust and corrosion. In the hard school of practical experience they have proved that, due to this extra protection, Beacon Windows cost much less for maintenance.

**JOHN THOMPSON BEACON WINDOWS LTD • WOLVERHAMPTON**

## A MILESTONE IN TEMPERATURE CONTROL

The Thermocontrol Electronic Variator System is the simplest and most accurate way of maintaining a constant indoor temperature. Professor Berglund of Uppsala has carried out tests showing that in spite of wide fluctuations of outside temperature the Electronic Variator has maintained an internal temperature of plus or minus 1°—a great advance in the control technique of heating installation.

- ★ Outside unit responds instantaneously to temperature fluctuations, has no moving parts, needs no maintenance.
- ★ The early morning boost can be set according to the needs of building and varies the amount of boost according to outside temperature.
- ★ Night shut-down controlled—the outside detecting element acts as a 'frost stat' without the additional cost.
- ★ The site adjustment also allows for the curve relating outside temperature with internal water flow temperature to be adjusted according to the characteristics of the installation.

WRITE TODAY FOR FULL DETAILS TO DEPT. V.2.

## Pyrotanax

COPPER COVERED MI CABLES

PERFECTED BY EXPERIENCE

The use of the trade name "Pyrotanax" is exclusive to the products of this Company and its associates.

That "Pyrotanax" is so generally used for wiring where there is risk of fire, or where water, oil and fumes are present, has in some quarters, created the impression that it must necessarily be expensive. Per foot run it may sometimes be a little more costly than conventional cabling, but "Pyrotanax" is a self-protecting cable and requires no conduit or other form of protection. That in itself takes quite an amount off installation costs. Moreover, "Pyrotanax", with its seamless ductile copper sheath, can be easily bent to conform with structural contours and requires fewer clips or saddles for support thus effecting a **considerable saving in costly labour**. All things considered, a "Pyrotanax" installation on any job is an economy from the start—and for all time, because it needs no maintenance.

*A non-technical description of "Pyrotanax" is given in our booklet "Current Carrying." For the technical man "Technical Data" is available—write for your copy.*

## THE ALLIED SOCIETIES

THE Town and Country Planning Act of 1947 largely completed the long process of delegation of power from central to local government in regard to building matters begun by the local government acts in the middle of the last century. Since the war the need for the direction and application of organised architectural opinion on a regional and local basis has been greater than ever. On paper, at least, the machinery for this does exist but its aptitude for the task has been questioned in some quarters recently.

The R.I.B.A., unlike most of the other comparable professional institutions, has no branches. The needs of members in the provinces, and overseas for that matter, are served by a framework of independent and autonomous architectural societies in "alliance" with the R.I.B.A. Membership of these societies is open to other than R.I.B.A. members: some include surveyors. These societies, with their branches and chapters, are distributed geographically to cover the whole of the United Kingdom. As they are the result of a process of growth rather than of a single plan their characters are various, their sizes uneven and, understandably, their outlooks diverse. They are financed largely by a rebate of one-third of his subscription paid by the R.I.B.A. for every R.I.B.A. member who is a member of each society. They appoint representatives to serve on the R.I.B.A. Council and through the Allied Societies' Conference they can express their opinions to the R.I.B.A.

The machinery within the United Kingdom by which the R.I.B.A. keeps itself in touch with local opinion thus appears adequate, but it is much more doubtful whether the machine works adequately in reverse, as it were. An allied society is not "under command" of the R.I.B.A. It is an ally. It may reject, though it very seldom does, an expression of R.I.B.A. policy on any matter of general interest. But, what is more important, it is the only instrument available to the R.I.B.A. in the particular area for pressing for the implementation locally of that policy. Since so much government auth-

ority in the building world is delegated to local authorities, County, City and District Councils, pronouncements by the R.I.B.A. at national level have little effect unless pressed home at these more dispersed levels by the local agents or allies.

The Allied Societies, then, are the field formations which must fight for the acceptance of the R.I.B.A. policy which they in their other capacity have had a hand in framing. It was said in the war that there were no good or bad battalions, only good and bad commanding officers. This is to some extent applicable to the Allied Societies. Apart from one or two comparatively rich urban societies the officers of societies, branches and chapters are all honorary, and a heavy additional burden must consequently fall on a number of busy architects, whether in private or official practice. The activity and effectiveness of the organisation, be it a centralised urban society or a scattered rural branch, will depend almost entirely on the energy of the chairman and honorary secretary.

It has been suggested that the hand of an allied society in local affairs would be strengthened if it were more closely incorporated into the R.I.B.A. The "West Blankshire Society of Architects" is not immediately connected in the lay mind with the R.I.B.A. but there would be no doubt about the "West Blankshire Branch of the R.I.B.A." This does not seem a very substantial point and there should be little difficulty if every opportunity is taken for close contact with those in responsible positions in local government circles. It would be better still if far more architects took a hand in local affairs by being elected to County and Borough Councils.

In some areas there is an inclination by private practitioners to look on the allied society as a protective association and to measure its value by the extent to which it upholds private against official practice. That is not the job of any architectural society. Whatever view is taken of the proper function of an allied society, any internal discord can do nothing but weaken its influence

in local affairs. At a time when the pressure on the architectural profession from without is so heavy the only policy that gives any hope of success is one of complete unity in fighting for these things essential to architecture. Benefits to the individual architect will follow success as a matter of course.

The real contribution the Allied Societies in the United Kingdom have to make is in wise guidance in local affairs. So much of this is best done informally. "Asking the R.I.B.A. to ask the Minister to order . . ." is usually quite impracticable. On the few occasions that a word comes from the great ones it does as much harm as good for the lesser ones resent interference in their local kingdom.

The Allied Societies overseas are of a different stature in fact if not in constitution as written in the R.I.B.A. bye-laws. They are more truly independent and stand on their own feet. Some of them administer the registration ordinances in force in the country. Yet they still look to the R.I.B.A. as the central co-ordinating body on matters of broad policy.

It would not be such a bad thing if the societies in the United Kingdom remembered more often the international status of the R.I.B.A. and looked upon it less as the curator of the British Isles.

## EVENTS AND COMMENTS

### THE A.B.S. BALL

According to the *Evening Standard* this mammoth party was attended by over a thousand architects. I believe in fact that the total number of *persons* attending was about a thousand and thirty. My guess is that there were about three hundred architects present making with their partners about six hundred architectural souls. The remainder being contractors and sub-contractors. Many of the architects were at contractors tables, you could tell that by the distribution of Magnums and even Jeroboams of champagne. The truly architectural tables being decorated with half bottles from the best distinguished vineyards and breweries.

Judged as a money raiser the Ball must have been a terrific success; one well-known stall-holder told me that he had taken over ninety pounds. An unwanted cooked sucking pig which had already earned more than its keep in a raffle was sold by auction and fetched a further twenty pounds. A thick, glossy programme contained advertisements from nearly all the best firms and must have brought in quite a lot of money.

As a dance the function had none of the terpsichorean elegance of the Hammersmith Palais. In slow time it was a jam-packed shuffle and in quick a hurly-burly where pinching, elbowing and shin hacking were all part of the fun. The band played with spirit and when there was room the younger guests cut capers, rugs and the older members with carefree abandon. It is a true sign of the times that the only thing temporarily lost or found was a diamond watch.

As a display of fashion and beauty the ball was well up to standard. Skirts were to be seen of all lengths from a trifle short to very much too long and waists were all over the place. The men were as usual a pretty shabby lot and far too many were in dinner jackets. I saw one smart gent with a velvet collar and another in most splendid whiskers. The remainder formed a rusty, dusty, black background for their, happily, very much brighter partners.

The organisers did their job very well and the proof that they did will no doubt be found in the balance sheet. All the same it seemed to be taking things a little too far when the first thing one saw on arriving was a notice saying that the 1956 A.B.S. Ball would be held in the same room on Wednesday, December 12. Although the A.B.S. has many voluntary helpers, some of whom are quite terrifyingly zealous, their work would be of comparatively little value without the backing of the permanent secretary Miss Solly. Charming and always cheerful Miss Solly is so much a part of the A.B.S.-A.R.C.U.K.-R.I.B.A. set up that those who know her tend to forget that there are others who do not. I suggest that any architect who does *not* know Miss Solly should call on her the next time he is in or near Portland Place, leaving a contribution to the A.B.S. with her to mark the occasion.

Speaking at the Building Exhibition's A.B.S. lunch recently Mr. Aslin, the president (to the power of three), remarked on the queer fact that if asked point blank in the street man will always part with a 10s. note while he seldom replies if asked by post. Ten shillings a head from all the architects would make the A.B.S. very happy. Have you a clear conscience?

### ARCHITECTS HOMES COMPETITION

You have already seen the preliminary notice of the postponed A.B.S. competition for 20 homes for old architects. The more serious entrants for this competition will certainly begin by re-reading Trollope's novel "The Warden". I have not seen the conditions but I am given to understand that some pretty clear directions are given as to the type of architecture which is wanted. A good centre of the road up-to-date English cottage style would no doubt be acceptable to—or even demanded by—aged architects of the moment but what of the future? Surely it would be a wise precaution to design framed structures each with a number of different external wall treatments, so that when the time comes the leader of any particular architectural style fallen on evil times, frail and ageing, can retire to a haven of rest discreetly, yet unmistakably reminiscent of his palmier days.

This or something very similar seem to me to be quite essential if true charity is to be done. Apartheid, Danegeld, the Poll Tax and the Com. Laws hold or held no hardship comparable to forcing some architects to end their days in an aesthetically incompatible building.

Please do not let these considerations deter you from

having a bash at this interesting competition. After all you never know it may be your one chance of getting your dream home.

### NEW H.Q. FOR S.A. ARCHITECTS

Overleaf is a perspective of the winning design by Charney & Margoles for the H.Q. of the Institute of South African Architects. Fifty-nine designs were submitted. In their report the assessors, Messrs. J. N. Cowin, N. L. Hanson and E. Douglas Andrews point out that the problem was a difficult one because administrative and club accommodation had to be provided in more or less self-contained areas; the administrative area being sub-divided to accommodate both architects and town-planners. The maximum permissible cost and site limitations added further difficulties.

The assessors liked the winning design for its simplicity, economy, ease in circulation and use of levels. In detail, however, they found some of the planning disappointing. For example they criticise the placing of the caretakers flat over the main room. They consider the Council suite and Board room inadequate in height and they do not much like the proportions, lighting and ventilation of the Main Room.

On the question of cost the assessors praise the realism shown throughout the scheme and although they do not consider that they can altogether accept the competitors' figures they think that the scheme is as likely as most to come within the stipulated cost.

It is interesting to note that the cubing rates for the winning designs were as follows:—

Garages, stores, foundations	...	2s. 6d.
Ground and first floors	...	4s. 6d.
Roof buildings	...	3s. 6d.

The total estimated cost was just under £30,000.

In their report the winners make a point of the ease of access to various different sections from the street. The split level arrangements help to provide this. In general the construction is an R.C. frame. Over the Main Room the slab is of hollow blocks 21in deep, thus eliminating visible beams. The external finishes are of white and grey pre-cast terrazzo slabs with black granite plinth, bronze doors, frames and lettering and white terrazzo grille and sunbreakers.

It is interesting to note that while we are now gradually denied assessors' reports in this country, they are still very much the fashion elsewhere. It seems to me that an assessor does only half of his job if he fails to make known his reasons for selecting the prize-winning designs.

### THE PRESERVATION OF HISTORIC BUILDINGS

Usually when we attend exhibition openings at the R.I.B.A. it is with a slight sense of guilt. We feel that perhaps we should not after all have taken time off to hear this or that ambassador, these or those foreign architects. We could very well—indeed much better—

see the exhibitions on another day. Then we realise that if we did not go to the opening ceremonies, bidden by a card from the R.I.B.A., we would very probably never go at all. Often it would not greatly matter, excellent though many of the exhibitions are.

The present exhibition, illustrating the work of the Ancient Monuments Branch of the M.o.W., is both interesting and important. Interesting because it shows how the very large job of preserving the 600 odd historic buildings in the Ministry's care is done and important because the methods employed are the results of 40 years' experience and can of course be applied to the many thousands of other historic buildings required to be maintained by other bodies and individuals.

The very good photographs and text of the exhibition are supported by models, actual pieces of material and a first-rate but cheaply produced handbook. The exhibition includes sections on masonry, brickwork, timber, plasterwork, structural problems, and ironwork.

Opening the exhibition in a blinking blaze of B.B.C. television newsreel camera lights, Mr. Nigel Birch of the M.o.W., spoke feelingly of the ravages of dry-rot. The Ministry, it seems, also has its estimates upset by that painful and almost universal complaint *merulus lacrymans*.

I understand that this exhibition is to go on tour but do not wait for it to turn up. Go and see it at the R.I.B.A. and while you are there call on Miss Solly of the A.B.S. (see above).

### DRAWING OFFICE TECHNIQUE

Elsewhere in this issue you will find details of an evening symposium on how to produce various types of drawing in the office. Short papers will be read by four architects and the discussion will be opened by a contractor. This is one of the R.I.B.A. Science Committee's better ideas. Drawings of the types to be discussed will be exhibited and Peter Shephard will be in the chair.

I noticed in the Tretol exhibition that an above average number of entries were drawn in a way most suitable for reproduction. A selection of them is on view at the Building Centre until 22 December.

ABNER

### Correspondence

Dear Sir,—It is encouraging to witness the advent of refreshing, well-mannered and often exciting design in Espresso Coffee Bars. At the beginning of the present rash we were treated to some rather unfortunate interiors. Interiors that seemed intent on using all the contents of an up-ended barrel of tricks applied *ad lib* and *ad nauseum*.

The present stage of the Espresso "growth" is being injected with the essence of architectural quality in the hands of some extremely capable designers. Their handling of space, materials and colours together with an instinct for the carefully balanced and well-integrated whole is indeed an important contribution.

There is one unfortunate basic factor which I find

distressing and that is the design of the Espresso Coffee machines themselves. These are very nearly without exception in the "juke box" tradition and tend to be the vulgar discordant element in some of these excellent interiors.

Perhaps if the Espresso craze grows exceedingly large, we shall find an English offshoot machine in a more clean-cut sensible design to challenge the Gaggia near monopoly and their maintenance service which I understand is exceedingly good.

Although the Continental influence in the design of Espresso Coffee Bars is very great at the moment in London, which, indeed, is very appropriate considering how cosmopolitan the metropolis is, it may well be that an English idiom will be evolved. The provinces in taking the Espresso Coffee Bars to their hearts might produce this influence.

I am not particularly hopeful of the Espresso Coffee Bar

becoming a serious rival to the public house nor, indeed, particularly desirous. I do not see them capturing the essentially chummy atmosphere. They also are of course at a disadvantage on the type of brew distributed.

They have however got off to a better start than the Milk Bars with their ice-cream parlour architecture. One of the interesting factors which is contributing to the demand for individual design is that they are mostly individually owned rather than company owned as in the case of so many of our public houses. In the public houses there is a tendency for the pattern to be repeated throughout the chain.

I await with interest the further development of the Espresso craze which is providing a good opportunity for jostling the public with contemporary progressive ideas even though in a restricted manner.

Yours faithfully,

W. HOME.

Perspective of the winning design by Messrs. Charney and Margoles. The plans are shown on the facing page

### **Institute of South African Architects Competition for H.Q.**

In the competition for the design of a Building for the Institute of South African Architects, limited to members of that Institute, the Assessors, Messrs. J. N. Cowin, N. L. Hanson, and E. Douglas Andrews, A./A.R.I.B.A., M./M.I.A., have made the following awards:

- 1st Premium of £200 :  
Messrs. Charney & Margoles.
- 2nd Premium of £150: Philip Karp.
- 3rd Premium of £50 :  
Messrs. Hadden & Allen.

The Promoters were the Central Council of the Institute of South African Architects, whose first Congress was held in 1928. The site of the proposed headquarters is on the corner of Biccard and Hoofd Streets, Johannesburg. Fifty-nine entries were received. The winning design is reproduced from the October number of *The South African Record*.

The Assessors, in their report, made the following observations:—

In spite of its limited scope, the programme presented considerable difficulties.

The conclusion of both club facilities and office administration (itself sub-divided) within a framework severely limited by cost and site, challenged the ingenuity and resourcefulness of competitors. It is not surprising, therefore, that a solution meeting every requirement ideally was not easily found. The programme was deliberately framed to allow a wide freedom of interpretation by competitors and to encourage the formulation by them of their own ideas in the compact arrangement and multiple use of the accommodation. In the event, few have succeeded in reducing the complexities of the

programme to a straightforward workable arrangement, and none has achieved a completely satisfactory all-round solution in architectural terms.

Basically, the problem set was the clear division of the club function of the building from the administrative, while maintaining a working relationship between both functions. In addition, the cost factor necessitated an overlap in the services to be provided for the building as a whole. Further, it was desirable, if it was possible to do so, to maintain a degree of separation between the offices provided for the Central Council and those of the T.P.I. and Chapter. Equally desirable was the provision of ready means of access to the offices of the latter two bodies. Economy in the administration of the building as a whole seemed to point almost inevitably to the placing of these offices adjacent to the entrance of the building. Lastly, the use of the club and meeting facilities by members was to be encouraged by correct location and easy direct access.

It was in the light of these considerations that the Assessors judged the schemes submitted. While many schemes embodied attractive features in one respect or another, a satisfactory basic plan arrangement achieving the demands outlined above was, in the final analysis, the primary requirement. In general, competitors ran into difficulty in balancing the material factor of convenience against the demands, important but intangible, of the overall design. It may well be that the programme postulated unusual difficulties; nevertheless the three premiated designs have succeeded in varying degrees in reconciling within the framework of compact planning its inherent complexities.

### The Winning Design

The Assessors comment as follows on the winning design:

"This scheme is notable for the fact that its author, in facing up to the realities of the programme, has evolved a remarkably simple, an almost 'inevitable' solution. In the handling of the main elements of the plan, in economy of circulation, and in effective use of the levels of the site, the solution offered is outstanding, and taken as a whole, well ahead of all other schemes. The use of half levels, though not unique in the competition, has nevertheless achieved the principal planning objectives of the programme with a minimum of complication and with the directness that is refreshing. Thus the grouping together, in the northern wing, of the General Office and the offices of the T.P.I. and Chapter (adjoining and overlooking the Entrance Foyer) gives effective separation from the offices of the Central Council, while maintaining essential contact. The half flight down to the latter suite and to the cloak rooms is a fully acceptable arrangement. The pattern is completed by the half flight up to the Main Room, with a further half flight up to the remainder of the club facilities, well placed in the northern wing. Clearly, in this plan, the lack of a lift in the building will prove no drawback to its proper functioning now or in the future.

Its good qualities notwithstanding, the scheme has yet not fully realised its potentialities. The detail planning, while showing deft touches, is often disappointing. Many practical issues are far from fully resolved, and modification and changes will have to be made before the scheme may be considered practicable."

## Evening Symposium on Drawing Office Technique

*An Exhibition of the different types of drawings used by Architects today and a discussion on the best means of producing them.*

The discussion, organized by the R.I.B.A. Science Committee, will take the form of a symposium and is to be held on Tuesday, January 17, 1956, at 6 p.m.

Five Architects have been invited to describe any special procedures in their offices to produce, with the minimum of effort, clear and comprehensive drawings for all purposes from the first commissioning of a project to its completion.

It has been suggested to the speakers that the problem should be treated under the two main headings — *Project Drawings* and *Production Drawings* and that they should describe any special procedures in use in their own Drawing Office.

The meeting will be thrown open for general discussion after the Papers have been presented, and it is hoped that Architects, Contractors, Engineers and other users of architectural drawings will attend the Meeting and take part in the discussion.

An exhibition of drawings contributed by several invited Architectural Offices, including those of the speakers will be on display concurrently with the symposium and will remain open for viewing throughout the week commencing January 16, 1956, at 66, Portland Place.

Each contributor to the exhibition has been asked to exhibit samples of the drawings produced for a single complete project and to indicate the total number of drawings used of each type shown.

The organizers feel that in a period of changing conditions and methods when much attention is being given to productivity throughout the Building Industry it is important that Drawing Office technique should keep pace with thought in design, administration and construction. It is hoped that the symposium will provide a useful opportunity to review Architects' drawings and the way that they are produced, and to compare the methods by which the problem outlined above has been approached and surmounted by different types of offices.

The following will take part in the Symposium:—

*Chairman:* Peter Shephard.  
*Speakers:* A. W. Cleeve Barr; Henry Elder, M.B.E.; Richard Sheppard; Gordon Tait.

The speakers will contribute to the exhibition of drawings either as individuals or as representatives of an architectural office, and the following have also been invited to supply drawings:—

The Hertfordshire County Council; Messrs. Tayler and Green; D. H. McMorran, A.R.A.; Sir Thomas Bennett, K.B.E., F. R. S. Yorke.

The discussion will be opened by P. Trench, O.B.E., T.D.

## L.C.C. Architect in Canada

Mr. A. W. Cleeve Barr, A.R.I.B.A., Senior Architect in charge of the L.C.C. Architects' Research and Development Department, is on a visit to Canada as the guest of the British Columbia Lumber Manufacturers' Association, Vancouver. The purpose of the visit is to ascertain how far Canadian methods of timber frame construction are applicable to building practice in this country.

## COMING EVENTS

### Royal Institute of British Architects

December 19 at 6 p.m. Library Group Meeting. The evening will be devoted to a talk by W. A. Eden, F.R.I.B.A., on "Vitruvius on Public Architecture," at 66 Portland Place, W.1.

### The Association of Supervising Electrical Engineers

December 20 at 6.30 p.m. "The Heat Pump with reference to Domestic Installations," by G. Peter Watson, A.M.I.E.E. (Ferranti Ltd.), at the Lighting Service Bureau, Savoy Hill, W.C.2.

## ANNOUNCEMENT

R. T. Kennedy, C.B.E., A.R.I.B.A., M.T.P.L., has left the Ministry of Housing and Local Government to commence private practice at 14 Harley Street, W.1, (Tel. No. MUSEum 0383) in association with William Holford and Partners.

## CORRECTIONS

In his article on the Building Exhibition, Mr. David Jenkin referred to "Kynalok" Secret-Fix Cladding, and said that the roofing version was called "Kynal." We are informed that this is not correct, as the word "Kynalok" is used for this type of cladding whether employed for roofs or walls. All "Kynalok" Cladding is made from "Kynal" aluminium alloys made by the I.C.I.'s Metal Division.

The Tretol design ascribed to "John Birchell" was in fact by John Bicknell, A.A.Dip.(Hons.), A.R.I.B.A.

## ADDENDUM

The two Assistant Architects to Bridgewater & Shephard who worked on the St. Martin's Bank, illustrated in last week's issue, were Gordon Michell and G. E. West. The following suppliers are additional to those already mentioned in the article: Sanitary fittings, Adamsez Ltd.; supply of all special timber and veneers, Messrs. Mallinsons; suspended ceilings, G. Jackson & Sons Ltd.; venetian blinds, Deans Blinds Ltd.; windows, Henry Hope & Sons Ltd.

Tomorrow H.M. The Queen is to open London Airport Terminal; architect, Frederick Gibberd; Consulting Engineers, Sir William Halcrow & Partners. The Director-General of Works, Air Ministry, was responsible for Construction. The picture shows the S-E Face Passenger Handling Building.

From Southwest

## Two Houses at Oxshott Surrey

architects: POWELL & MOYA

THE site is triangular and about 4 acres in area. It is served by a private road on the North, bordered by a row of trees. Beyond the South boundary is a dense wood. A railway line runs in a deep cutting along the East boundary, although this cutting becomes an embankment at the far South West corner. The site slopes down quite steeply from East to West along the road frontage. There are fine distant views to the North and West. Other new houses have been built along the road on each side of the site but they are not very prominent and detract little from the pleasant meadow-like quality of the site.

### Requirements

Both houses had to be designed to comply with the restrictions in floor area which existed at the time and to a very modest budget. Apart from the normal Local Authority approval, the Commissioners for Crown Lands' approval was also necessary. House No. 1 is on the higher part of the site and is occupied by a married couple with three small children. The owner of this

SITE PLAN

house wanted a bungalow. House No. 2 is on the lower part of the site and is occupied by a married couple with one small child. The owner of this house wanted at any rate part of his house on two floors, as an upper floor on the lower portion of the site would enjoy exceptionally good views.

### Design

The houses are long and thin and are built along the road frontage so that all living-rooms and bedrooms enjoy the sun and the views to the South and are placed in such a way as to see and hear as little of the railway as possible. This siting has involved building against the

*The south front of house No. 2*

## Two Houses at Oxshott

contours of the site—the slope in the length of house No. 1 is 6ft and of house No. 2 is 9ft. To conform with the character of the site and to cut costs, the houses have been linked together and “terraced” down the site. In house No. 2 where the slopes are greater, the client’s preference for a two-storey living wing has allowed the natural and economical answer to the siting problems. In house No. 1 the gentler slope is exploited by dropping the floor level of the living-room to give it greater height than the rest of the rooms.

### Areas and Costs

House No. 1—Area of house 1,417 sq ft. Area of store and garage 223 sq ft. Final cost £4,001. House No. 2—Area of house and store 1,422 sq ft. Area of garage 122 sq ft. Final cost £3,803.

### Construction and Finishes

External Walls: cavity construction, external leaf 4½in

London Stock Facings, internal leaf 4in clinker blocks. Internal bearing walls: 4½in brick.

Ground floor: 1in concrete screed on damp proof membrane on 4in concrete on hardcore. Intermediate floor of house No. 2: normal timber joist construction.

Roofs: “Stahlton” pre-stressed hollow pot construction, insulated on top with 1in cork and water-proofed with patent 3-ply roofing felt (laid without falls) and with a finish of grey granite chippings. Fascias are fair-faced *in situ* concrete with aluminium flashings. The garage roofs are of timber joist construction and are finished on top with boarding and 2-ply bituminous felt.

Windows: soft wood (Ejma type opening lights) with hard wood cills. The sliding window in the living-room of house No. 1 is of hard wood and is glazed with double plate glass.

Non-structural walls: “Highworth” partitions con-

sisting of a core of  $\frac{3}{8}$  in plasterboard with stretched galvanised wires both sides which act as reinforcement for the  $\frac{3}{8}$  in plaster skins.

**Internal Finishes:** Floors are finished generally with thermo-plastic tiles or linoleum, except for the living-room of house No. 1, which has cork tiles. Walls and ceilings generally are plaster and finished with distemper or emulsion. The fireplace walls are of unplastered brickwork finished with emulsion. Internal cills are of a slate-coloured precast concrete.

**External Colours:** Yellow London Stock bricks. Paintwork generally black and white. The kitchen porch soffit of house No. 1 and the front door porch soffit of house No. 2 are bright red. **Internal Colours:** predominantly white. The bedroom corridor ceiling of house No. 1 is matt black.

**Services:** The plumbing is all internal, including the rain-water drainage. Water heating is by an "Agamatic" boiler, which also feeds radiators in the living-room wings of each house. Electric cookers are used. The electrical installation uses ring main circuits with 13-amp "domestic sockets" fused plugs. Light fittings are on a separate 5-amp circuit. The light fittings in the living-room of house No. 1 were designed by Bernard Schottlander.

# Electrical Space Heating Appliances I

The next article on this subject will appear in February 1956.

## Domestic Electric Heating

by J. I. BERNARD

Chief Technical Officer to the  
British Electrical  
Development Association

**T**HERE has never been any doubt about the efficiency of electric heating; moreover those who have tried it find that the cost in practice is not as high as some people led them to expect, especially nowadays when the cost of current shows a very moderate increase in comparison with the rise in price of all kinds of fuel.

However efficient electricity may be, there is sometimes a doubt as to its effectiveness in providing the kind of warmth and comfort required. Electric heating often signifies nothing more than one or two portable electric fires; the wide variety of electric heating equipment is not sufficiently well known nor is the fact that the price of appliances compares favourably with a conventional system of central heating, even allowing for purchase tax, which, incidentally, the Beaver Report (Cmd-9322, para. 72) recommended should be removed in the interest of Clean Air. In consequence there is a great need for the architect to be able to specify the right kind of electric heating equipment to suit the comfort and taste of any prospective user and to know how it can best be installed to give the greatest amount of convenience and satisfaction in every day use.

### Trends in Domestic Heating Practice

The days when the acme of domestic comfort consisted of a blazing log fire or large lumps of coal in a well-grate which could be poked into a roaring fire to counteract a disagreeable draught drawn up the chimney have passed, because the fuel is no longer available, but the traditional love of an open fire dies hard and

Screen heater No. 5420, Premier Electric Heaters

most people still like to see a bright radiant source of heat in some sort of fireplace setting which from a furnishing point of view also forms a centre of interest in a living room.

One of the most important features of heating by a fire is that most of the heat is given off as radiation and so the air temperature is appreciably lower than when heating by convection is employed as it is in a central heating system.

The important difference between the two principal methods of heat transfer, radiation and convection, should be clearly borne in mind when discussing domestic heating problems. In an office or other building where the heating is more or less continuous, the walls, floor and ceiling take up a temperature which is very little below the air temperature of say 65-68deg F required for comfort; in other words the mean temperature of the surroundings is practically the same as the air temperature. In most domestic premises, however, continuous heating is not required, it may in fact be disliked in certain parts of the house, for example, in

## Domestic Electric Heating

bedrooms where many people prefer to sleep with a window open. In addition the ratio of external wall to the volume of the room is much greater in small domestic premises and the occupants are more closely surrounded by the walls than they are in a commercial or industrial building, with the result that there is a far greater sensation of chill from cold walls and windows in a house than any other kind of premises. Accordingly the main problem is to find the best remedy for this "cold radiation" so to speak, although this is actually a contradiction in terms since only heat is radiated; what happens is that the warm human body loses heat at an abnormally high rate in radiation to the cold walls.

### Value of Radiant Heat

It has been found from a large number of physiological observations of occupants of rooms with various air temperatures and mean radiant temperatures that if a mean radiant temperature of say 50deg F is caused by cold walls and windows, the air temperature needs to be 75deg or higher in order to obtain anything like conditions of comfort. Even so the conditions are far from ideal, because the body is losing heat by radiation at an uncomfortable rate which is barely counterbalanced by the high air temperature. In regard to the best method of correcting this unbalanced condition consider first the possibility of improving matters by convection of air heating. Hot air will, of course, begin to raise the temperature of the walls but one has only to realise the small amount of heat air can hold to understand what a slow process this is in warming up brickwork having a weight of 1,000 times as great. An extreme example of this difficulty which may be a matter of personal experience is trying to create conditions of comfort in a small brick or concrete garage by means of an oil stove. The stove produces a current of very hot air and products of combustion but many hours must elapse before alleviation takes place in the feeling of chilliness due to the cold walls.

But there is fortunately an alternative which is very much more effective and that is to counteract the sense of chill by introducing a source of radiant warmth. An electric fire in an ordinary room will, for example, produce, within a few minutes of switching on, an output of radiant warmth which will go far to counteract the chilliness of the walls, and will thus avoid the need for an excessively high air temperature. This can be proved, if proof is necessary, by the results of scientific investigations by Bedford, Fishenden, Vernon and others, which show for example that a mean horizontal radiation of 75 B.Th.U. per sq ft per hour, raises the estimated mean temperature of the surroundings from 65 to 80deg F and this ensures an equal condition of comfort with an air temperature of only 55deg F instead

of 65deg F. Such a reduction in air temperature explains why there is a much greater feeling of freshness with radiant heating than there is with convection or hot air heating, especially when the latter is accompanied, as it often is, by a considerable temperature gradient from floor to ceiling so that the air at head level is some 5deg F or more warmer than at floor level. Another feature of radiant heating is that the lower air temperature reduces the heat losses through the walls and by air change, which in turn reduces the running cost.

### Intermittent v. Continuous Heating

The electric fire is not the only source of radiant warmth; equally good, if not better results, can be obtained by having heated panels or skirtings but to provide the same amount of heat they must have a much larger surface area because of their lower temperature and on account of the fundamental law of radiation which says that the output depends on the 4th power of the absolute temperature. The characteristics of different types of panel and other forms of "low temperature" electric heater will be described later since, for the moment, it is desirable to revert to the question of comfort and to point out that if a room or part of a house is left unheated in very cold weather the amount of radiant warmth necessary to overcome the low air temperature and cold walls may be more than the ordinary electric fire can provide. This leads to the idea of preventing the inside of the fabric from falling below a certain temperature level say 45deg F by some form of electric heating which, when operated under thermostatic control, will prevent the house from ever becoming too chilly. Incidentally, it may be noted that such a form of background heating operating at a constant temperature is different from that provided by a continuous burning stove which operates at a constant heat output irrespective of weather conditions.

Since there is no point in heating rooms when unoccupied, the relatively small amount of heat which is required to prevent the structure becoming too cold and the contents damp is all that need be provided if the object is to secure the greatest possible economy, it being understood that an electric fire will produce conditions of comfort in a very short time in any room that is going to be occupied. Automatic control can be provided, if necessary, by a time switch arranged to switch on an electric fire in a kitchen or breakfast room automatically some little time before it is wanted in a morning.

The flexibility of control and the precision of electric thermostats and time switches ensure the greatest possible economy—coupled, of course, with the ease with which electric heating can be switched off altogether when not wanted. Electric thermostats are inexpensive as well as accurate and reliable so that one can be fixed in each room together with a switch controlling the heating; in this way heat can be regulated to suit the requirements in individual rooms in a much simpler manner than turning off valves on hot water radiators.

### Structural Insulation

The question of how much heat is required to prevent the various rooms in a house becoming too chilly depends very largely on the standard of thermal insulation to which the house is built. Electricity, being a high grade form of energy, should not be wasted, and when the saving in running cost over a reasonable life for the house is calculated, the increased capital cost of a well insulated house can easily be justified. This can readily be shown if, for example, the capital is to be borrowed on mortgage. Suppose that a 1,250 sq ft house is built with cavity walls using insulating blocks for the inner skin, an insulating quilt over the first floor ceiling and wood blocks over a solid concrete floor; the maximum heat loss will be almost half that of a similar house with solid 9in walls, suspended floor and no insulation in the roof (which until recently would have been regarded as quite a common form of construction). The saving in electricity for heating to the same degree of comfort (in practice some of this saving is usually spent on a higher standard of comfort) may be as much as 4,000 units a year, costing at 1d. almost £17, which at a mortgage rate of 5 per cent will justify an increased capital cost of £340; this will not only cover the extra cost of construction mentioned but would also pay for further insulation e.g. weather-stripping of external doors and the double glazing of one or more windows with a north aspect.

In any house in which the heating is more or less intermittent, and that means most houses, there is another thermal property of the structure which is of more importance than is generally recognised, namely the inner surfaces of the walls should have as little heat capacity as possible. The simplest description of this property is that wall surfaces should be warm to the touch. To give a practical illustration, a wood panelled room can be brought to any given condition of comfort more quickly than one with brick walls with a dense plaster finish; still better results from the point of view of quick warming up are experienced in rooms lined with insulating board but an appreciable benefit is obtained from vermiculite plaster covered with thick wallpaper.

### Future Developments

There is no doubt that more attention will be given in the future to the heating of domestic premises in order that we may have houses which are kept warm easily, which can be left to themselves without becoming too chilly for reasonably comfortable re-occupation after an absence of a day or a week and in which one or more rooms can be quickly brought to a condition of comfort and then maintained in that condition without labour or supervision.

Electricity is destined to provide a clean and convenient heating service of this kind on an increasing scale as the need for cleaner air becomes better appreciated and as atomic energy is developed to supplement our limited fuel resources.

So, in looking to the future, two main objectives are

bound to stand out more clearly, the first to build a house so that it will not only be warm as well as dry but also have really low heat losses, much lower than current practice. Secondly to instal some suitable background heating together with types of electric fires which are both attractive in appearance and effective in quickly producing conditions of comfort.

### Firebar and Reflector Fires

As the majority of people in this country still prefer and are likely to continue to prefer, at least for the living room, some form of fire using the term to describe a luminous source of high temperature radiation, electric fires are the most important as well as the most popular type of electric heating appliance. The earliest forms of electric fire were of the firebar type, as they are called in the electrical industry. In these the heat is developed in a spiral of nickel-chromium alloy wire laid in grooves in the face of the bar of fireclay. Such a firebar rated at 1 kilowatt, i.e. using 1 unit an hour, may measure about 4in  $\times$  10in and one, two or three of them may be fitted in a suitable cast or sheet metal frame to make a complete fire. Heat is radiated not only from the red-hot spiral but also from the fireclay itself which attains a steady temperature after about a quarter of an hour from first switching on, and then acts as a high temperature radiant panel.

The smaller amount of radiation from the back of the fireclay slab goes to warm the interior of the fire which is generally hollow so a current of warm air rises through it and helps to heat the room by convection. The front face of the firebar may be straight or slightly curved in plan and mounted at a slight angle to the vertical so that the distribution of radiant heat is generally of the form indicated in Fig 1, and this, in conjunction with the convected heat, gives what is often termed a "fire that warms the whole room".

If this distribution of radiation would be inclined to scorch furniture in a small dining room, for example, another design should be selected in which the firebar

Fig. 1. Distribution of radiant heat.

## Domestic Electric Heating

is sloping so that the heat is thrown more in an upward direction.

The other main type of electric fire is the so-called reflector type in which the heating wire is wound on a fireclay rod mounted in the focal point of a curved reflector, in order to concentrate the radiant heat mainly in one direction like the light from a lamp with a reflector behind it. The heat capacity of the rod is much less than that of the firebar so that a reflector fire reaches its steady temperature in a much shorter time, say 5 minutes or less and this, coupled with the heat concentration effect, accounts for the greater popularity of this type of fire.

The distribution of heat depends upon the shape of the reflector and there is considerable difference between the various designs available. If the element rod is of small diameter so as to approximate to a line source and the reflector is parabolic in section like a motor-car headlamp, the radiation will be confined to a flat beam as indicated in the vertical distribution in Fig 1 which shows that anyone sitting in an armchair will be bathed in radiant warmth from the feet to the chest (high temperature radiation on the face or head is not pleasant for any length of time). The horizontal distribution will depend upon whether the reflector is straight or curved but for a living room designs are available which will spread the warmth round the family circle as shewn in the diagram.

### Inset Fires

A fire of this type built into a tiled surround is shown in Fig 2 and if the large chromium plated reflector is thought to have a cold appearance there is an alternative metal finish which is similar in colour to bright copper and which maintains its appearance even in dirty atmospheres without requiring much cleaning. When fixed in a fireplace, chimney ventilation can be effected if desired by narrow slots or louvres in the frame surrounding the fire.

As to the electrical loading, i.e. the kW, of the fire to be installed in various rooms, there is a simple allowance of 1-1½ watts per cu ft which is a sufficient guide bearing in mind that most fires are made in loadings which

Built-in electric fire with lighted surround.

are multiples of one kilowatt, i.e. 1, 2 or 3kW. The smallest size is only suitable for very small rooms; the 2kW size can be regarded as the general purpose loading suitable for rooms up to say 14ft x 16ft. Intermediate loadings can be obtained for some makes of reflector fire in which there are interchangeable elements of .75, 1.0 and 1.25kW, which give a useful adjustment of loading according to the heat loss of the particular room or other conditions of use, e.g. some extra power for very quick heating up might be required in a small flat whose occupants are out all day.

For bedrooms electric fires are made for building into walls (usually termed Inset type), or for fixing to the surface of a wall without any prepared recess, the latter being termed Outset or Panel type. In the past there has been a tendency to fix these fires at too great a height from the floor which from a comfort point of view is a serious fault; in a bedroom especially, warmth is required on the feet more than other parts of the body. One reason why fires were fixed at knee or waist height in the past may have been the fear of clothes catching fire but now that all fires have to comply with the Fireguards Act there is no reason to fix them at anything but the best height from the comfort point of view.

When specifying wiring for electric fires in bedrooms advantage should always be taken of the convenience of electricity to have a switch controlling the fire fixed at the bedside.

### British Standards

B.S.816: 1952. Requirements for Electrical Appliances and Accessories (applies to all electrical appliances and accessories such as switches and socket-outlets not more specifically covered by other British Standards).

B.S.1670: 1951. Safety Requirements for Electric Fires.

B.S.1945: 1953. Fireguards for heating appliances.

### Codes of Practice

C.P.321. Electrical Installations — General.

C.P.321.101. Choice, Installation and Maintenance of Electric Wiring Systems.

C.P.324.201. Installation of Domestic Electric Space-Heating Equipment.

### Regulations

Regulations for the Electrical Equipment of Buildings issued by the Institution of Electrical Engineers.

Fig. 2. Built-in electric fire.

## POINTS FROM PAPERS

## Modular Coordination— an industrial tool

*from a paper read before  
the Modular Society on  
15 November, at the  
R.I.B.A., by*

LENNART BERGVALL,  
architect S.A.R.

*Wall and window detail of a small house  
built in a system designed by the author.*

**W**HAT is really the purpose of modular coordination? You may feel that this is a very elementary question to raise in an assembly like this, but I think that much of the discussion around various details in modular coordination is due to the fact that we have not answered a number of such elementary questions clearly enough. It is important to keep in mind that modular coordination has been created as a natural—and necessary—complement to standardization. Consequently, the very purpose of modular coordination is exactly the same as that of standardization, namely to promote industrial mass production. It should be clearly kept in mind that the standardization is an inevitable consequence of industrial production—handcraft, on the other hand, has no use for it.

Standardization promotes this industrial production mainly by concentrating the demands to a limited number of types and sizes, thus permitting or facilitating large-scale production, production for stock, or automatic production.

The various standardized, industrially produced building parts, however, must fit into each other on the building site, and must be made so that they can do so in a number of different combinations, which cannot be determined in

advance, if any freedom is to be left for creative architecture. This is where modular coordination comes in. The factory-made units must be fitted into a general dimensional system with a common denominator, the module. The object of modular coordination must then be, firstly, to allow advanced standardization and industrialization of the production of building parts, and secondly to accelerate the removal of the production from the building site with its unfavourable working conditions to the industry of building materials and parts, where conditions are more suitable for rational production. That is why modular coordination is basically an industrial tool.

But why do we want this industrial production of the houses? For me the answer is very clearly this: because it is the only way to get cheaper homes so that once we will find the building industry self-supporting and not subsidized, as is now the case in nearly all countries. It is not for the benefit of the architect, the engineer or the builder that we have worked for years for modular coordination, but it is in order to give a contribution to solve the enormous problem of housing in the postwar world. It is still too early to forget what Le Corbusier said already in the twenties: "L'architecture ou révolution", architecture or revolution.

The answer to many of the modular questions depends

**VENTURA DIVISION**

GRAMS MERCHADVEN LONDON

on our basic conception of modular coordination. For us, modular coordination means that all linkage dimensions of the building parts and all room dimensions are multiples of our basic unit, *the module*.

This means first that modular coordination deals only with linkage dimensions and does not try to restrict the choice of other dimensions such as e.g. table height. Therefore, also anthropometric data are of little significance in modular coordination. As for Le Corbusier's attempt to base a whole system of "modular" coordination on so called "human dimensions", I like to ask "What is really 'human dimensions'?" If we try to use the human height as the dimensional basis, should we use the average height of a tall American or of a tiny little French girl? Also, I fail to see that one foot (30, 5cm) is a "human dimension", whereas 3dm (30cm) should not be so.

This conception of modular coordination also means that the architect shall in principle have all the freedom, that is offered by a grid, with *the module* as meshwidth. This is the reason why the module can't be too large; the restrictions in design would then be intolerable both from architectural and economic point of view. It's also the reason why it's necessary to stick to the conception of a *basic module*, although for some items (e.g. piping) we need to use half modules and it could be said with some reason that in such a case its half the module, which is the real basic dimension. The size of the basic module, the meshwidth of the grid, determines and limits the room dimensions that must be foreseen when we design for instance a system for prefab walls. The halfmodule is not taken into account there, but should only be used as an aid to make some special items to fit with the basic modular grid.

In connection with this I should like to make a clear distinction between the basic module, that is *the module*, on one side and unit size, planning grid and preferred dimensions with series on the other side.

As for *unit sizes*, we often hear that producers of prefab concrete wall units declare that about 4 feet is the economic width of their panels, so any economic use of their system requires that the plans are designed on a 4 foot grid. But if the enormous waste of space that this involves is taken into account we will see we can't afford to go on with it. It simply means, as I said before, that the dimensions of every unit (home, flat etc.) will in average be unnecessarily increased with half the meshwidth in both directions, that is 2 feet. What does this mean for a home 30 x 25 feet? An increase in dimensions to 32 x 27 feet means an increase in space of 115 sq ft, representing at least £2-300. Therefore the size of any planning grid cannot be determined by the prefab units; these must be designed to serve any good plan on the basic modular grid, if they shall be used *generally* and not only for a special kind of buildings (e.g. classroom wings in schools) or for a special project. But this does not mean, of course, that all prefab units should be one module wide, nor does it mean that the manufacturers have to abandon their 4 feet as the basic unit size. But they must be prepared to add to these units a small number of what I should like to call "change coins", that is smaller units, which in addition to the basic units can form any modular dimensions. If the sizes of these extra units are carefully chosen, they will only be a few per cent of the total number of units and need by no means affect the rational production of the larger basic units. This problem would easily be solved, if as much skill and imagination were devoted to it, as has been spent on creating new prefab systems. And only so can the growing prefab industry serve both architecture and economy.

The *planning grid* can be a very useful tool for a good and rational design of different kind of buildings but only when it is a servant and not a master. Therefore the size of the meshes in the planning grid should be determined by the functional requirements of the building and not—as I said before—by the unit size of any prefab system. The design of our homes must be guided by our own wishes and dreams and not by the clumsiness of our technique.

This means, that for dwellings no larger planning grid than the basic modular one is adequate. Because the module should just be chosen as the meshwidth of the largest grid, which—from architectural point of view—is generally acceptable for all kind of buildings. That is the reason, that in the modular research work in our country, leading to the 1dm module, we never seriously considered anything larger than 6in for a module.

Now, as a matter of fact, dwellings allow less restrictions in design, than any other kind of buildings, because there the most complex functions have to be satisfied within a most limited area. But for other types of buildings a larger planning grid may prove rather valuable. For big industrial buildings a large planning module of something like 8 feet may be right, because then the economic effect of the restrictions in design may easily be balanced by the gain from standardization of roof constructions and so forth. In the same way a planning module of 40 inches or of 8 feet might be a valuable tool for a rational design of school buildings—or properly speaking the classroom wings in school buildings. For other parts of a school that planning module may well be too large. An example may prove that. At an excursion in connection with an E.P.A. conference in Paris we were shown a school, which was totally designed on a planning grid of 1,75 metre—5ft 10in—considered as ideal for the classrooms after a careful investigation. But this

Factory pre-manufacture of wiring octopus. Note the bench is marked in units of the module.

### Modular Coordination, an industrial tool

school contained a lot of other rooms dwellings for the staff etc., and for these it had been impossible to make a good and economic design within that large grid. The same may hold true for, say, a hospital, where one planning grid may be ideal for the bed wings, another one for office and dwelling wings. Therefore we have to foresee a number of different planning grids for different kinds of buildings. But for a full economic effect these different planning modules have to be standardized, and preferably on an international scale.

The general industrial standardization has long since used series of preferred dimensions to allow a reasonable choice of sizes. For this purpose industrial standards are usually based upon geometric series, the Renard series, which make it possible to cover a certain range of size with the least possible number of standard units. But this is used as a tool for standardization, being the servant and not the master. When f.i. functional studies give a clear indication that sizes outside the series are very highly frequent, it may be considered to abandon the Renard series. It's life itself that shall be satisfied by standardization, not an abstract mathematical principle. It would be wise to consider—as very often where technical matters are concerned—that it's not the mathematics that are complicated, it's life itself. Even a very complicated formula or series is only a very, very rough approximation of the far more complicated realities.

Also in building standardization, the use of series may be very helpful for choosing the right sizes for standardization. Even if the arithmetic serie formed by all multiples of the module limits the number of sizes to a certain extent, this is not at all sufficient. To make a rational choice some kind of series is necessary, something corresponding to the Renard series, only that we must add to them still another condition, that of interchangeability. Therefore the problem of series is more important and far more complicated in the building industry than in the general industrial standardization. But the importance of this problem would probably not have been duly recognized, hadn't it been for the excellent and thorough studies of this subject, which have been carried out so penetratingly by our friends Mr. Bill Allen of the Building Research Station and Mr. Bruce Martin of the British Standards. Even if much is yet to be done in this particular field of standardization, I am grateful that they have drawn our attention to the importance of this subject. But it is to be noticed that it's rather a question of standardization and general coordination, than one of modular coordination, because from the definition of the module, it follows as self evident that all linkage dimensions of a standardized building part should be multiples of the module. The purpose of the series again, is only to help us to select the right multiples. However, I don't intend to deal here more in detail with the different alternatives for such series; they have been discussed most thoroughly in this society before. I only like to draw your attention to the fact, that while all the series considered have been geometric series, just as the Renard series, building itself is arithmetic in character. To build is just to create, materially, with our hands an arithmetic serie.

But geometric series have been introduced in the building industry long before, as we all know, already by the ancient Greeks and Romans, not for technical reasons though, because there was no technical need for it, but for purely aesthetical reasons. This has recently been reintro-

*Mechanization in the factory, a moving circular saw cuts an endless strip into modular units, produced automatically.*

duced by Le Corbusier with his "Modular system", which I mentioned before. Le Corbusier himself claims that the use of his modular series ensures harmonic proportions of our buildings in a much better way, than "face" design. I am not going to argue about that. But suppose for a moment that this were true, how would it affect our views on modular coordination? Not at all. It just gives us another tool to select those multiples of the module that we believe will ensure harmony in design.

I think I can sum up all this by saying that there is no contradiction between the arithmetic serie formed by all the multiples of the module on one side and the geometric series on the other, whether Renard Series, Le Corbusier's modular series or the "Allen series", if I may call them so, as long as they are all used as tools for a better selection of multiples of the module, the basic module that is.

I do not intend to deal here with the intricate question of the placing of the grid in general. I will only draw your attention to some facts, correlated to my attempt to clarify our basic conception of modular coordination. There has been, in this country and in most others too, a lot of discussion whether the grid lines should coincide with the surface of the walls—at least theoretically—or with the centres of the walls. But, as long as we stick to a real modular design, where the thickness of the interior walls are equal to the module—or a multiple of it—we will find that both principles will result in the same design, the same room dimensions and position of the units. Also we will find that it is not at all necessary that the joints between the units coincide with the grid. I will show later how this has been applied to a strictly modular prefabricated system with very good result. Our conclusion in Sweden therefore is, that so far we feel the simplest and most natural way to place grid—which is the basic planning grid—is in coincidence with the wall surfaces. However, this need not prevent the builder and the architect from using the wall centres for indicating the position of the walls, just as is now tradition in most

# PROTECTION?

There are ways and means of protecting most things, but when it comes to paintwork it pays to remember that paints based on Titanium Oxide are renowned for outstanding durability. These modern paints stand up to sun, rain and frost and they are unaffected by the sulphurous fumes of the industrial areas. Paints containing Titanium Oxide combine covering power and brightness with durability and high gloss.

Issued in the interest of better paintwork by

Factories at Grimsby and Billingham and at Burnie, Tasmania. Agents in most principal countries.

[ADVERTISEMENT]

## The No. 50 LOWBURN continuous burning fire with boiler flue set

### Choice of two detachable extension pieces

**1. Standard.** With extension piece down, the fire burns more efficiently and with less trouble than any ordinary open fire.

With extension piece up, the fire will stay alight for ten hours or more. It can be left to burn unattended and no live fuel can possibly fall out on to the hearth.

**2. Trivet.** If desired the combined hook-on trivet and extension piece, as illustrated, can be supplied instead of the standard fitment.

The combined hook-on trivet and extension piece is shown in position for overnight burning.

If the boiler is not used to provide domestic hot water, 45 sq. ft. of radiation surface (including unlagged piping) can be heated.

**Hot Water System.** The recommended size of cylinder is 30 gallons (direct or indirect).

### NOTES:

**2 inches lower than average** continuous burning fire of this type—and very pleasing to the eye. Low costs—to buy, to install, to run.

The No. 50 Lowburn Fire is an approved appliance. It burns for 10 hours without attention on all recommended fuels, including coke.

### The difference the low front makes

The maximum radiant heat is directed at the lowest possible level.

It is economical because a few lumps of fuel—not a whole scuttle full—are enough to give a cheerful blaze.

### INSTALLATION DETAILS

### SPECIFICATION:

Vitreous enamel cast iron front with extension for overnight burning. Fire-brick lined fire box, removable bottom grate and adjustable air inlet in fire front.

Wrought welded or copper boiler with 1 in. side tappings right or left hand, and cast iron self-contained boiler flue and damper. Operating tool and mild steel ashpan. With or without gas ignition burner.

The unit can be supplied prepared for, but without boiler.

Colours.—Cream Mottle or Black, Alisheen Black, Bramble, Bronze or Copper.

**Gas Ignition Burner Connections:**  $\frac{1}{4}$  in. B.S.P. on either hand.

### Fuel Consumption:

Average figures are:—

Winter Conditions .....  $1\frac{1}{2}$  to  $2\frac{1}{2}$  cwt. per week  
Spring and Autumn .....  $\frac{3}{4}$  to 1 cwt. per week  
Minimum or overnight rate .....  $\frac{1}{2}$  to  $\frac{5}{8}$  lb. per hour

**Space Heating Capacity:** Full heating up to 1,500 cu. ft.

**Boiler Output:** Maintainable maximum 9,000 B.Th.U. per hour.

Provided the system is compact the boiler can heat a towel rail in addition to supplying domestic hot water.

The No. 25 Lowburn, a continuous burning fire without boiler, is also available. For further information about the No. 50 or 25 Lowburn Fires, write to the Housing Division of:

## ALLIED IRONFOUNDERS LTD

Makers of cookers, boilers, fires and baths

28 Brook Street, London, W.1.

countries, because modular grid is one thing, the measures on the drawings for the builder another one.

I have hitherto not dealt with the size of the module other than in principle. Of course, as you may know, we in Sweden have decided years ago on the 1dm module, and the report at the last E.P.A. meeting in Munich was strongly in favour of a 1dm module. However, I realize quite well, that here this question is much more intricate, because of your foot-inch system, and it takes much more of knowledge of the situation than I have, to deal with the subject from this point of view. I should like, however, to throw some light on the question of what influence the brick dimension may be allowed to have in this respect. In the imagination of most laymen and—unfortunately—even in that of many experts a house still consists mainly of floors, walls, ceilings and roof, just as it always has done—and in addition to that some new items of secondary importance, installations etc. But this conception of a building is outmoded and inadequate in our time. Now the structure itself represents only some 30 per cent of the total building cost, and of these about one-third may represent the brick walls in a so-called brick building. So actually, when we consider to let the problem of the brick dimensions hold back modular coordination, we allow a building part, representing some 10 per cent of the total, prevent us from using an excellent tool to rationalize all the other parts representing some 90 per cent. I know there are complications but it's very useful to consider what importance the very structural material really has nowadays compared with the rest of the building.

As we adopted modular coordination, on a 1dm base, in Sweden several years ago, you may well ask, what practical results and experiences we have got. As we have considered modular coordination mainly as an industrial tool, it has been of special interest for the manufacturers of building materials. Against that background it may be worth mentioning that the "Modular Investigation" which opened up the building trade in our country for modular coordination was wholly financed by the National Association of Manufacturers. In full consequence with this conception of modular coordination, we found it—after a time of somewhat confused discussions, which seem inevitable, when you try to introduce modular coordination—to be the best policy not to start with forcing the architects into a rather unknown field of modular design, but instead use modular coordination as a tool for the standardization of building materials and parts, so that gradually we should get a stock of modular components, thus making architects and builders conscious of modular coordination and all the questions of tolerances and so forth that go with it. So now we feel ready to try to give the architects and builders a detailed instruction in modular design and encourage them to really go ahead with it. But to have a firm foundation for that, we will—co-ordinated with the E.P.A. work—design and build two absolutely modular houses, one home in wood frame construction and one prefabricated concrete apartment house. First after we have got all experiences from that

experiment do we feel ready to launch modular coordination on a wide scale, in spite of the fact, that we have already about 100 of the most important building components modularly standardized, the brick among them, although that standard is rather new, because it has taken a long time for the brick industry to convince themselves. But here—as in so many cases—the finally deciding factor has been a desire not to be left behind in the technical evolution. And very rightly so, because the time is not far away, when only modular building components are adequate and those, who have early made themselves familiar with the problems involved and are prepared to meet the new age in building, will then have a very definite advantage, compared with non modular competing materials.

We have also found that this has been the best, if not the only possible way, to make the ordinary people in the building industry acquainted with the problems and principles of tolerances, which at least in our country, was completely new to them. But when standard after standard is released and brought into work, where all necessary dimensions are given with an adequate tolerance, they gradually grow familiar with it. Of course we all know that the building industry for many reasons must work with larger tolerances, than f.i. the mechanical industry, but that is no reason at all to abandon the use of them, rather the contrary.

I said that our standards are modular, but that does not necessarily mean, that all dimensions are a multiple of the module, but that all linkage dimensions are properly coordinated with the modular dimensions. Take f.i. tubes for electric wiring. These are kept in storage, standing on end, so that the lower end of it will always be destroyed about one inch from the end, and that part is supposed to be cut on the site. So the standard length of it is not 30 modules but 30 modules plus about an inch.

You may also ask what economy we have found in modular coordination. Well, I think that question is impossible to answer because how could we separate the influence on the building costs of modular standardization from that of rationalization in general, rising price level, rising dwelling standard and so forth? Those who want to be dead sure on each penny before they dare to jump into modular coordination will simply miss the point. Before every new step in the technical evolution you will find that technical and scientific research can guide you to a certain point, but beyond that you must dare to rely on intuition. All important inventions were created by such a combination of scientific skill, intuition and faith. And modular coordination is no exception. Most of us have seen building sites so often, that we have almost begun to accept the hopeless mess and disorder there compared with a well organized factory. This is not to say that our builders should not do the best of a given situation; it's the system, not the builders that is wrong. And who can foresee the economic gains of the miracle of order in building industry?

Sections through floor, wall and partition units of the A B Bostadsforskning system.

**E15/5**

This two-gallon pressure paint container is the latest addition to the products of Alfred Bullows & Sons Ltd., of Long Street, Walsall, Staffs. The shell of the container, as well as the cover, is of high tensile aluminium alloy diecasting. The cover is held in position by F.S. "C" clamps and hand screws for speedy removal. The feed pipe is of duralumin. All parts in contact with paint are of aluminium alloy or stainless steel. Container is available with or without pressure reducing valve unit, which is flange mounted on the cover and houses the shrouded pressure gauge. It has a built in safety valve with easing ring, so that it is used as a blow off valve and is non-adjustable. Container also available with galvanised M.S. shell for use with materials corrosive to aluminium. Maximum working pressure of containers: 50 lbs per sq in. Hydraulically tested to 100 lbs per sq in.

**FITTINGS**  
**GAS COOKERS**  
**C6/11**

The new "Pixie" cooker by Sidney Flavel & Co. Ltd., of Eagle Foundry, Leamington Spa has been designed to cater for the requirements of two or three people. Both grill and oven doors drop to form plate rests and there is incorporated an American style combined grill and dry-fry griddle. An extra boiling burner can be supplied in place of the grill-griddle. The gas taps are of the "press and turn" safety type. Accessories: Oven shelf, cake tray, meat tin, grill pad and grid, cooking chart. Measurements: height 20in x width 17in x depth 16in. Weight: 60 lbs. Finish: Cream or white vitreous enamel.

**PLANT**  
**FACTORY EQUIPMENT**  
**E14/16**

A scrubbing and drying machine has just been introduced by the Cowlard Floor Maintenance Machine Division of Matting Ltd., of Park Lane, Wolverhampton. Known as the Saturn II, this machine performs two functions simultaneously, scrubbing away the dirt and then lifting it from the surface of the floor so that it is left clean and dry. It is battery-powered and includes two galvanised tanks, one for water and detergent and the other for sludge; a high speed motorised air extruder running at about 14,000 r.p.m.; a continuously rated 1 h.p. brush drive motor running at approximately 2,000 r.p.m.; lifting jacks and the Microjusto wheel control. The equipment is powered by a 24-volt Exide-Ironclad traction battery with a capacity of 175Ah. The Matting traction unit is driven by a constant speed 24-volt motor. Transmission is effected through a heavy duty single-plate clutch and gearbox having three forward speeds and reverse.

**PLANT**  
**OFFICE**  
**EQUIPMENT**  
**E12/16**

A new spirit duplicating machine specially designed to provide economic working for offices and establishments which have a need of short runs has been introduced by Byron Business Machines, of

Arnold Road, Nottingham. Known as the Polycarp Spirit Duplicator, the new machine requires neither ink nor stencil and gives both clean and economic working. Up to 200 copies can be obtained from each master sheet if it is operated efficiently. It also provides for multi-coloured reproductions, graphs and illustrations and either quarto or foolscap size paper can be used.

## INDUSTRIAL NOTES

● The 75th edition of the "Statistical Abstract for the Commonwealth and Sterling Area" was published on December 5, for the Board of Trade by Her Majesty's Stationery Office, Kingsway, W.C.2, and branches, price 17s. 6d. This publication brings together in the same volume the basic trade statistics of Commonwealth countries up to 1954.

● Owing to the growth in the size of the Electrical Engineers' Exhibition, it has been necessary to obtain larger premises to house the Exhibition Company. The registered address will still remain as before but all correspondence and interviews will be carried out at 6 Museum House, 25 Museum Street, London, W.C.1. The telephone number, Museum 3450 remains unchanged.

● The second Hardware Trades Fair, which will be held from the 20th-24th February, 1956, will be twice the size of the first one, and will occupy both the Royal Horticultural Halls, Westminster.

● Home Heating Ltd., designers of central heating for homes, offer a heating service which embraces small and large dwellings, whole estates or blocks of flats, and specialise in selecting the most advanced and efficient system or combination of appliances for each individual need and utilising any fuel. The address is 28 Baker Street, London, W.1. Telephone Welbeck 4949.

● The sales and administration departments of Messrs. Ewart & Son Ltd., manufacturers of gas water heaters, have moved to 255 North Circular Road, Neasden, N.W.10. Telephone: Willesden 1234.

● Vacuum Oil Company Ltd. announce that on the 1st December, 1955, the name of the company was changed to Mobil Oil Company Ltd. There will be no change in the ownership, management or policy of the company.

## OBITUARY

● We regret to record the death, on December 2, of Colonel S. M. MacGuire, O.B.E., M.C., aged 63, Chief Public Relations Officer, George Wimpey and Company Limited. Colonel MacGuire joined the company in 1935, and became Public Relations Officer in 1945.

● Mr. Arthur Dawson, Managing Director of Celotex Limited, passed away suddenly on Monday, November 21. Mr. Dawson joined the company as secretary in 1937.

● The British Vacuum Cleaner and Engineering Co. Ltd. have announced the passing of Mr. Seymour Booth, a Director for many years.

## CORRECTION

● In the issue of November 17, page 634, the top line of column 2 should read: "Calorex" sheet glass for heat absorption. Also, on page 641 the weight of "Trofdek" should read as 2/3lbs/sq ft.

# It's here!

Consisting of hundreds of wood spirals bonded by their edges in an immovable unity with the plywood facings, the "PLACAROL" core has a strength and stability hitherto unobtainable in semi-solid flush doors.

*The "PLACAROL" core offers these unique advantages—*

- It's all timber—a traditional material in a new form.
- Uniform support of the door facings prevents surface undulation.
- Much greater strength with a saving in weight.
- Complete stability and rigidity.
- Vastly improved quality and dependability.

### Meet Timothy Percival Augustus

after his bath and about to be embedded.  
From a steaming hot bathroom he is crossing  
an Alaskan landing to enter an Arctic bedroom.

No wonder he's always catching cold — he  
lives in a sieve! Yes, a house that leaks heat  
in all directions, especially through the roof.

The architect who designed it should be  
made to wash all Tim's hankies . . .

What's to do about it? \*

### Meet Timothy Percival Augustus,

drawing rude horses on the wall, because he's too hot to sleep,  
because there's no roof insulation to keep the house cool,  
because the architect didn't know, didn't care, or forgot to . . . \*

\* *wrap him in*

when it's a question of flooring

**RILTILE** is the complete answer, being an ideal combination of all those properties long sought for in flooring. The outcome of intense research based upon long experience, this new thermoplastic hard tile is recommended with every confidence for use in hospitals, kitchens, bathrooms, offices, shops, bars, restaurants.

**RILTILE** is made in tiles only, measuring  $9'' \times 9'' \times \frac{1}{4}''$ , in a wide range of colours and mottled effects and at a cost to compare favourably with good quality inlaid linoleum. Damp proof, heat insulating, with excellent resilience, **RILTILE** is also impervious to dilute acids, alkalis, and is resistant to hot and cold water. It should be noted that only 12 hours are required after laying, before the floor is ready for normal traffic. While not completely fireproof, the asbestos used in the manufacture of **RILTILE** gives it excellent fire-resisting qualities.

**RILTILE**  
Thermoplastic Flooring

Extremely hard wearing ☐ Easily and quickly laid  
Reduces foot fatigue ☐ No special cleaning required

## The Thermal Insulation of Buildings

About a third of the total national consumption of fuel is used in heating buildings. This manual aims to provide building designers with information on the use, performance and cost of those materials which, by reducing heat losses from buildings, can have a significant influence on the national economy.

Price 12s. 6d. (By post 12s. 10d.)

## The TOUGHEST flooring in the WORLD!

What a claim! but how many other floors would stand up to an elephant on roller skates! It might sound ridiculous but seriously, it's the best way we can illustrate how tough and smooth INDUSTRIAL-VINYL-SURFEX really is. Made from a unique formulae that GUARANTEES the same even tensile strength throughout the material, it can be laid over almost any new or existing base.

It cannot crack, lift or craze. Water and fireproof, it's also impervious to oils, grease and petrol. You see, INDUSTRIAL-VINYL-SURFEX was made to withstand the hardest wear, and that's why it's a 'must' for Factories, Machine Shops, Warehouses, Garages, Chain Stores, Banks and anywhere where there is a constant stream of foot or truck traffic, including elephants on roller skates!

# Denton's DENTOLITE

## + Self-Sterilising + EMULSION PAINT

*The only paint of its  
kind in the world*

"We would like Dentolite Finish but for this job it need not be self-sterilising."

This is typical of many requests received by us and appears to be the result of a misunderstanding brought about by the very success of DENTOLITE as a germicidal and fungicidal finish.

Actually, DENTOLITE is the best quality P.V.A. Emulsion Paint it is possible to produce. It is non-poisonous, free from odour, scrubbable and dries with a beautiful satin sheen. ONE COAT OVER ANY SIMILAR COLOUR GIVES FIRST-CLASS OBLITERATION.

DENTOLITE'S special self-sterilising properties are due to the unique method of manufacture (World Patents applied for) which confers on it the properties of permanently resisting disease-producing germs and mould, making it the PERFECT HYGIENIC WASHABLE WALL FINISH.

DENTOLITE is available in thirty attractive pastel shades AND COSTS NO MORE THAN ANY OTHER FIRST-CLASS EMULSION PAINT.

Shade cards, scientific reports, technical literature, etc., will gladly be sent on request.

## One Coat of B.P.L.

## Fibre Board Sealer

provides a

## Non-absorbent Paint

## Surface for Soft

## Board

To prevent the rapid absorption of gloss paints by soft board British Paints Limited in conjunction with Tentest Fibre Board Co. Ltd.,—has developed this new sealer. A single application provides a satisfactory surface for subsequent paint coats.

Where low cost or time saving are important a gloss finish can be obtained with a single coat of enamel, though the normal undercoat naturally improves the finish and gives increased durability to the paint system employed.

### Simple Preparation

B.P.L. Fibre Board Sealer can be mixed with either hot or cold water. A hot mix is quicker. It is always applied cold.

One gallon covers approximately 30 square yards.

Supplied in packets each containing approximately 1 lb.

Full details from the sole manufacturers.

## BRITISH PAINTS LIMITED

Portland Road, Newcastle upon Tyne

In conjunction with

Tentest Fibre Board Co. Ltd., 75, Crescent West, Hadley Wood, Barnet.

## RUSTPROOFING . . .

Which would you rather have—structural steelwork which will involve you in high maintenance costs, or steelwork which will remain almost permanently rustproof at a slightly higher initial cost. If you are looking ahead, no hesitation is possible.

"RUST-ANODE" is referred to as cold galvanising because it deposits a 92/95% pure zinc coat on steel, this is strongly adherent and rustproof. The metal to metal contact obtained ensures cathodic protection, and no rust creep under the protective layer can take place.

Start right with "CAPALLA" chemical pretreatment to remove rust and impurities, and to provide a suitable key, followed by "RUST-ANODE" cold galvanising.

## PLASTRONGA FITTING

FOR JOINTING "POLYORC A" AND OTHER POLYTHENE TUBING

**MADE FROM A NEW HIGH-STRENGTH POLYTHENE**

- The Polythene from which PLASTRONGA Fittings are made is far stronger than normal type of Polythene—has superior physical properties and provides an ALL-POLYTHENE joint having excellent mechanical strength.
- PLASTRONGA Fittings are much lighter in weight than metal fittings.
- They require no wrapping or protection when pipelines are buried underground.
- No metal sleeve inserts are necessary in tube ends.
- Joints easily and quickly made by inserting specially flanged Polythene tube ends into body of fitting and screwing up the nuts.
- Like Polythene tubing, PLASTRONGA Fittings are non-toxic and non-contaminating; resist corrosive effects of acid waters, manures and fertilisers.

# STRUCTURAL ECONOMY

## FOR THE ARCHITECT & BUILDER

This book, by G. Fairweather, F.R.I.B.A., aims at making a critical analysis of traditional forms of construction with the following objectives: to identify the main characteristics of buildings as these are determined by the materials and methods used for their construction; to examine these characteristics in relation to the functions and respects in which traditional forms of construction fall short of present-day requirements and to offer suggestions for improvement.

## map and plan mounting at **WEST**

**THE FIRST-CLASS JOB** speaks for itself! ....something to remind you perhaps of clean sheets newly aired! Smooth your hand across its surface. There is strength and durability, fine finish, fitness for its special purpose . . . .

The greatest care is necessary. No two lots of paper are exactly alike. Papers, cottons and mounting boards vary in tensile strength and shrinkage factor. A particular glue will suit one job—only a certain paste can be trusted for another. Generations of craftsmen have handed on knack and knowledge of this kind at WEST; we are constantly experimenting, testing, making sure!

Perfect processes include joining and mounting maps and plans of all sizes on to paper, cotton and board; providing and fixing roller and ledge fittings; fixing to spring rollers; mounting flat or cut to fold as for road maps; providing and fixing large wooden strainers as for theatre and exhibition displays; expert repair of torn and dilapidated documents; binding reports and estimates into book form; edge-binding with 'Byndite' or silk; and varnishing . . . . and we welcome new problems!

WESTY SAYS: We specialise in mounting up competition work—faultless presentation is so important.

In the field of map and plan mounting

**WEST** understand your problems

TELEPHONE: ABBey 3323

## Two ways to **HEAT CONSERVATION**

### ① DRAUGHT EXCLUSION

will reduce the rate of cold air infiltration through doors and windows, which is the source of all draughts, by as much as 95%. This in turn will cut down the loss of heat through the average window by at least half, and through doors by an even greater amount.

*EXAMPLE: D/H Sash Windows of wood, 5' 2" x 2' 8", average length and width of gap, 18' 0" x 1/4", average wind speed 10 m.p.h.*

The two HERMESEAL strips make a perfect draughtproof seal when window is closed

BEFORE draught-exclusion	1908.0 cu. ft. per hr.
AFTER " "	264.6 cu. ft. per hr.
PREVENTION achieved	1643.4 cu. ft. per hr. or 86.1%

### ② ROOF INSULATION

will reduce the loss of heat through a roof-area by at least 70%. This loss, in the average house, is about one-third of all the heat lost in various ways from the structure as a whole.

*EXAMPLE: Average "U" values of a number of Pitched roofs of new but varying construction. "U" = B.Th.U./sq. ft./hr./°F.*

BEFORE insulation (Desirable standard 0.20)	= 0.43
AFTER insulation by 1" bitumenised glass wool	= 0.13
PREVENTION achieved	= 0.30 or 69.7%

Specify DRAUGHT EXCLUSION and ROOF INSULATION by HERMESEAL. No higher degree of efficiency in the conservation of heat and the saving of fuel can be achieved in any already existing building. Surveys and installations are carried out by our own skilled staff throughout the country. Write for full details.

## APPOINTMENTS • CONTRACTS • TENDERS

Rate 1/6 per line, minimum 3/-

Close for press 1st post Monday for following Thursday Issue

### NOTICE

THE ISSUE DATED DECEMBER 22 WILL  
CLOSE FOR PRESS FIRST POST FRIDAY,  
DECEMBER 16. DECEMBER 29 ISSUE FIRST  
POST, THURSDAY DECEMBER 22.

### APPOINTMENTS

The engagement of persons answering these advertisements must be made through the local office of the Ministry of Labour and National Service, etc., if the applicant is a man aged 18-64 or a woman aged 18-59 inclusive, unless he or she or the employer is exempted from the provisions of The Notification of Vacancies Order, 1952.

#### BOROUGH OF LEYTON

(Non-County Borough in County of Essex. Population 103,200. R.V. £784,110).

APPLICATIONS are invited for the following permanent appointments at salaries in accordance with the National Scale Indicated:—

- (a) TWO ASSISTANT ARCHITECTS, A.P.T. Grade V (£700-£930 per annum).
  - (b) GENERAL ARCHITECTURAL ASSISTANT, A.P.T. Grade III-IV (£630-£855 per annum).
- The above salaries are inclusive of London Weighting (£30) which is reduced according to scale where the age of the successful applicant is less than 26 years. The commencing salaries will be fixed at a point in the scale according to the qualifications and experience of the successful candidate.

Candidates for appointments (a) must be Associates of the Royal Institute of British Architects and must have considerable experience in contemporary design and the construction and supervision of multi-storey flats. Candidates appointed will be employed in connection with the Corporation's extensive programme for Redevelopment Areas.

Candidates for appointment (b) must be Registered Architects and should have good experience in the design, construction and erection of public buildings. The successful candidate will be primarily engaged on the completion of a project for a Central Library. Housing accommodation may be made available if required.

Alternate Saturday mornings are free of duty and canteen facilities are available in the Town Hall.

Details of the above appointments and forms of application may be obtained from Mr. H. D. Peake, M.Sc.(Eng.), Borough Engineer and Surveyor, Town Hall, Leyton, E.10, to whom they should be returned not later than WEDNESDAY, 28th DECEMBER, 1955.

D. J. OSBORNE,  
Town Clerk.

Town Hall,  
Leyton, E.10. [1821]

#### PADDINGTON BOROUGH COUNCIL

REQUIRE ARCHITECTURAL ASSISTANT (APT III-£630 to £755 per annum). Candidates should be Incor. R.I.B.A. and be capable of preparing working and detail drawings and sketch drawings of smaller schemes and be quick and competent draughtsmen with an adequate knowledge of building bye-laws, housing manual standards and modern construction technique.—Applications, stating age, qualifications, experience and names and addresses of three referees should reach the undersigned (quoting A.262) by 28th December, 1955.

W. H. BENTLEY,  
Town Clerk.

Town Hall,  
Paddington Green, W.2. [1845]

#### PADDINGTON BOROUGH COUNCIL

REQUIRE ASSISTANT ARCHITECT (APT V-£780 to £930 per annum). A.R.I.B.A. candidates preferred with some experience in design and supervision of building works of some magnitude and a knowledge of local authority requirements. Applications, stating age, qualifications, experience and names and addresses of three referees, should reach the undersigned (quoting A.261) by 28th December, 1955.

W. H. BENTLEY,  
Town Clerk.

Town Hall,  
Paddington Green, W.2. [1844]

### APPOINTMENTS—contd.

#### BOROUGH OF OLDBURY

BOROUGH SURVEYOR'S DEPARTMENT  
ARCHITECTURAL SECTION

APPLICATIONS are invited for the appointment of one Assistant Architect, Grade A.P.T. V (£750 - £900), in the Architectural Section of the Borough Surveyor's Department.

Applicants for the appointment should preferably be Associate Members of the R.I.B.A.

The architect appointed will be required to work primarily on the design and construction of Municipal houses, maisonnettes and multi-storey flats, and previous experience of this type of work is desirable.

The appointment will be superannuable, subject to the National Conditions of Service and to the selected candidate passing a medical examination.

Applications, giving particulars of age, qualifications and experience and the names of two referees, should be delivered to the undersigned not later than Monday, January 2, 1956.

Housing accommodation will be made available to married applicants if required.

KENNETH PEARCE,  
Town Clerk.

Municipal Buildings,  
Oldbury,  
Birmingham.  
December 6, 1955. [1834]

#### LONDON ELECTRICITY BOARD

STRUCTURAL ASSISTANTS AND  
STRUCTURAL DRAUGHTSMEN

APPLICATIONS are invited for the above positions in the Construction Branch of the Chief Engineer's Department in Central London.

Applicants for the positions of Structural Assistants in the Civil Engineer's Section should have experience in the design and detailing of reinforced concrete, and/or steel framed superstructures and foundations.

Applicants for the positions of Structural Draughtsmen should have a knowledge of building construction requirements and/or some experience in detailing reinforced concrete or steel structures.

The posts are graded under Schedule 'D', National Joint Board agreement, as Grade 5 - £672 to £777 and Grade 6 - £535 10s. to £661 10s. per annum respectively, inclusive of London Allowance. Commencing salaries will be dependent on qualifications and experience.

Application forms, obtainable from Personnel Officer, 46/7, New Broad Street, London, E.C.2., to be returned completed by December 27, 1955. Please enclose addressed envelope and quote reference: V/2003/AA. [1810]

#### DUNDEE COLLEGE OF ART

SCHOOL OF ARCHITECTURE

THE Governors of the Dundee Institute of Art and Technology invite applications for the position of ASSISTANT, GRADE I.

Applicants should be members of the R.I.B.A. and should preferably be holders of a degree or diploma of a recognised School of Architecture.

Salary Scales: Men, £690 by £30 to £990; Women, £582 by £25 to £832, with placing according to qualifications and experience. These scales are at present under revision.

Applications should be lodged as soon as possible and should be on the prescribed form, copies of which, with full particulars, may be obtained from the undersigned.

F. RAYMOND WILKINSON,  
Clerk and Treasurer.

Bell Street,  
Dundee.  
December 5, 1955. [1835]

#### COUNTY BOROUGH OF EAST HAM

BONUS SURVEYOR—GRADE II (£560-£640)

LONDON Weighting is paid in addition. Salary in excess of the minimum may be paid according to qualifications and experience.

A subsistence allowance may be granted over a reasonable period to the person appointed if unable to obtain suitable housing accommodation, necessitating the maintenance of two homes.

Further details and application forms returnable by 30th December, 1955, from the Town Clerk, Town Hall, East Ham, E.6. [1849]

### APPOINTMENTS—contd.

#### PADDINGTON BOROUGH COUNCIL

REQUIRE BUILDING SURVEYING ASSISTANT (APT II-£590 to £670 per annum). Candidates should have practical knowledge of building construction, experience in surveying and levelling, the repair, adaptation and conversion of civil and residential properties, and be capable of preparing plans, specifications and estimates of costs in respect of these works and their supervision. Candidates preferred at advanced stage of preparation for R.I.C.S. Intermediate or equivalent examination. Written applications, stating age, qualifications, experience and names and addresses of three referees, should reach the undersigned (quoting A.263) by 30th December, 1955.

W. H. BENTLEY,  
Town Clerk.

Town Hall,  
Paddington Green, W.2. [1846]

#### IMPERIAL CHEMICAL INDUSTRIES LIMITED WILTON WORKS

ASSISTANT TECHNICAL OFFICERS

STRUCTURAL

VACANCIES exist in the design organisation employed in the development of a rapidly expanding factory at Wilton Works, situated in the North Riding of Yorkshire four miles from the coastal town of Redcar.

Appointments are to permanent staff with Pension Fund, Profit Sharing Scheme, 5-day working week and excellent Company recreational facilities.

Candidates should have the appropriate National Certificate and previous design office experience.

Reasonable out of pocket expenses will be refunded to applicants invited for interview and after joining the staff, married men will receive a reasonable refund of removal (including travel) expenses; to assist house purchase, facilities are available in approved cases for loans, in addition, legal charges may be advanced.

Write for application form to: Staff Manager, Imperial Chemical Industries Limited, Wilton Works, Middlesbrough, quoting advertisement reference ICH1270/c. [1847]

#### COUNTY OF HUNTINGDON

COUNTY ARCHITECT'S DEPARTMENT

## Roofing Timber?

Of course Phoenix can supply Roofing Boards, Tiling and Slating Battens to suit your requirements and they will do it without delay.

Phoenix can also supply Roof Trusses ready assembled to T.D.A. or your own specification. Do you realise that if you use Roof Trusses pre-fabricated by Phoenix you can reduce the cost of house construction?

*Your enquiry is welcome.*

## from Blueprint to finished Job...

## A complete concrete reinforcement service

The large range of "Expamet" Reinforcements provide a wide choice to suit all types of concrete construction. There are more than 100 standard variations and weights in "Expamet" Reinforcements from under 2 lb. to over 30 lb. per square yard.

### **Expanded Steel and Welded Fabric**

"Expamet" Expanded Steel Sheet Reinforcement; "Expamet" Welded Fabric; Super "Ribmet" and other specialist materials can be adapted to meet reinforcement problems of all kinds, from solid slab decking and hollow floors, to light shell construction such as barrel vault and dome roofs. They are just as effective reinforcing concrete in precast units as in sea defence works.

"Expamet" can be of assistance to you. Write or telephone, we shall be pleased to advise in the choice and use of "Expamet" Reinforcements for any job you have in mind.

Dome at Barclays Bank, Exeter; showing "Expamet" Welded Fabric reinforcement and "Ribmet" permanent centering. Engineers: J. F. Farquharson & Partners, London, W.1. Contractors: J. Garrett & Sons Ltd., Plymouth.

*Thickness of the concrete shell is 2½ ins., thickening out to 5 ins., at a distance of 3 ft. 6 ins. from the periphery, plus a 2 in. screed of light concrete. The dome is supported by a reinforced concrete ringbeam of columns, and has a diameter of 33 ft. 6 ins., a rise of 5 ft. 2½ ins. and a 40 ft. radius of curve. A 5 ft. diameter central dome light is fitted.*

### **5-Part Concrete Reinforcement Service**

- 1 Design with Economy.
- 2 Preparation of working drawings.
- 3 Supply of Reinforcements (Expanded Steel, Welded Fabric, Super Ribmet.)
- 4 Delivery on schedule.
- 5 Technical advice and Literature.
